---

It takes about a few minutes for the image quality to reach acceptable level. Please wait a few minutes or more after the monitor power has been turned on or the monitor has recovered from the power saving mode, and then view images for diagnosis.

---

Monitors should be set to a lower brightness to reduce changes in luminosity caused by long-term use and maintain a stable display.

# Chapter 1 Introduction

Thank you very much for choosing an EIZO monochrome LCD monitor.

## 1-1. Features

- 21.3 inches
- Supports a resolution of 5M pixels (Portrait: 2048 × 2560 dots (H × V))
- Uses high-contrast panel (1200:1).  
Enables the display of sharp images.
- Applicable to DisplayPort (applicable to 8 bit or 10 bit, not applicable to audio signals)
- The Hybrid Gamma function automatically identifies the display area for the medical and other images on the same screen, and displays each set status.  
\*1 The identification may fail depending on the displayed image. The software to be used needs to be verified. For validation, see “[Setting the highlight area in the image display area](#)” (page 16).
- The RadiCS SelfQC function and the built-in integrated front sensor allow the user to perform the calibration and Grayscale Check for the monitor independently.  
See “[Chapter 4 Controlling Monitor Quality](#)” (page 24).
- \*2 When a panel protector (RP-901) is installed, the Integrated Front Sensor cannot be used.
- The CAL Switch function allows the user to select the display mode optimum to the displayed image.
  - The ALT mode adjusts the brightness according to the ambient illuminance.
  - Most suitable mode for calibration  
See “[Selecting the display mode \(CAL Switch mode\)](#)” (page 13).
- Selectable DICOM ([page 42](#)) Part 14 complied screen.
- The quality control software “RadiCS LE” used to calibrate the monitor and to manage the history is included.  
See “[1-2. EIZO LCD Utility Disk](#)” (page 8).
- The software “ScreenManager Pro for Medical” to adjust the screen using the mouse and keyboard is included  
See “[1-2. EIZO LCD Utility Disk](#)” (page 8).
- Frame Synchronous mode supported (24.5 to 25.5 Hz (DVI signal input only), 49 to 51 Hz)
- Power saving function  
This product is equipped with power saving function.
  - 0 W power consumption when the main power is off  
Equipped with main power switch.  
When the monitor is not required, the power supply can be shut off using the main power switch
  - Presence Sensor  
The sensor on the front side of the monitor detects the movement of a person. When a person moves away from the monitor, the monitor shifts to the power saving mode automatically and does not display the images on the screen. Therefore, the function reduces the power consumption.  
See “[5-4. Setting the Power Saving Mode when a Person Leaves the Monitor](#)” (page 29).
- Long service life LED backlight LCD panel

- Built-in ambient light sensor

The ambient light sensor can measure the ambient illuminance in lux. Depending on the environment, the sensor sometimes indicates different values from those measured by a stand-alone illuminance meter.

The built-in ambient light sensor is used in the ALT mode or when the measurement is triggered by user operation in the corresponding menu of the “RadiCS/RadiCS LE” quality control software.

For further details about the measured value and how to execute the measurement, refer to the RadiCS/RadiCS LE User’s Manual (on the CD-ROM).

- Displays HDCP (High-bandwidth Digital Content Protection) protected contents (DisplayPort only).

#### **Attention**

- A high temperature or high humidity environment may affect the measurement accuracy of the integrated front sensor. We suggest storing and using the monitor under the following conditions.
  - Temperature 30°C or less
  - Humidity 70% or less
- Avoid storing or using the sensor where it may be exposed to direct sunlight.

## 5-4. Setting the Power Saving Mode when a Person Leaves the Monitor

The sensor on the front side of the monitor detects the movement of a person by setting Presence Sensor to “Auto” or “Manual”. When a person moves away from the monitor, it shifts to the power saving mode automatically and does not display the images on the screen to reduce the power consumption. When a person comes near the monitor again, it recovers from the power saving mode and displays the images. When “Manual” is selected, the detection area, sensitivity, and time until the power saving mode is activated can be set according to the monitor usage environment and movement of the user.

### Note

- At the time of shifting to power saving mode, the message that indicates shifting is displayed.

### Attention

- This setting cannot be used during “RadiCS SelfQC” execution.
- It also cannot be used during the landscape position display.

- Select “PowerManager” from the Adjustment menu, and press ENTER.
- Select “Presence Sensor” from “PowerManager”, and press ENTER.
- Select “Auto”, “Manual”, or “Off” with ▲ or ▼.
- Press ENTER to exit.
- After selecting “Manual”, set the details.

Item	Setting Range	Description
Range	70 cm 90 cm 120 cm	If a person leaves the specified detection area (perpendicular to the screen), the monitor shifts to the power saving mode. The setting ranges (on the left) show rough values.
Time	5, 30 sec 1, 3, 5, 10, 15, 30, 45, 60 min	Specifies the time from when a person leaves the monitor until the “No Presence detected” message appears. The monitor shifts to the power saving mode about 20 seconds after the message is displayed.
Sensitivity	Level 5	Regardless of whether the object is moving or not, the monitor cannot shift to the power saving mode if a person or a still object is present within the detection area. This setting is recommended if the monitor frequently shifts to the power saving, even though a user is in front of the screen.
	Level 4 Level 3 Level 2 Level 1	Since whether the object is moving or not is identified, the monitor can shift to the power saving mode even if there is a chair or wall in the detectable range. When the setting level is high (“Level 4” at maximum), even minor movements of a person are detected, causing the monitor to shift to the power saving mode only infrequently. On the other hand, when the setting level is low (“Level 1” at minimum), only major movements of a person are detected, allowing the monitor to shift to the power saving mode frequently. If the monitor does not shift to the power saving mode or recovers from the mode contrary to your expectations due to phenomenon such as the effect of lightening or ambient light, try decreasing the setting level.
Reset	-	All adjustments are reset to the default settings.

# Chapter 8 Glossary

## DDC (Display Data Channel)

VESA provides the standardization for the interactive communication of the setting information, etc. between a PC and the monitor.

## DICOM (Digital Imaging and Communication in Medicine)

The DICOM standard was developed by the American College of Radiology and the National Electrical Manufacturer's Association of the USA.

The DICOM compatible device connection enables to transfer the medical image and information. The DICOM, Part 14 document defines the digital, grayscale medical image display.

## DisplayPort

DisplayPort is a next-generation digital AV interface that allows connection of the PC, audio, imaging devices, etc. to the monitor. One cable can transfer sound with images.

## DVI (Digital Visual Interface)

DVI is a digital interface standard. DVI allows direct transmission of the PC's digital data without loss. This adopts the TMDS transmission system and DVI connectors. There are two types of DVI connectors. One is a DVI-D connector for digital signal input only. The other is a DVI-I connector for both digital and analog signal inputs.

## DVI DMPM (DVI Digital Monitor Power Management)

DVI DMPM is a digital interface power saving function. The "Monitor ON (operating mode)" and "Active Off (power saving mode)" are indispensable for DVI DMPM as the monitor's power mode.

## HDCP (High-bandwidth Digital Content Protection)

Digital signal coding system developed to copy-protect the digital contents, such as video, music, etc. This helps to transmit the digital contents safely by coding the digital contents sent via the DVI or HDMI connector on the output side and decoding them on the input side. Any digital contents cannot be reproduced if both of the equipments on the output and input sides are not applicable to HDCP system.

## Resolution

The LCD panel consists of numerous pixels of specified size, which are illuminated to form images. This monitor consists of horizontal 2048 pixels and 2560 vertical pixels. At a resolution of 2048 × 2560 (Portrait) and 2560 × 2048 (landscape), all pixels are illuminated as a full screen (1:1).

## TMDS (Transition Minimized Differential Signaling)

A signal transmission system for digital interface.

### Guidance and manufacturer's declaration - electromagnetic immunity

The RadiForce series is intended for use in the electromagnetic environment specified below. The customer or the user of the RadiForce series should assure that it is used in such an environment.

Immunity test	IEC/EN60601 test level	Compliance level	Electromagnetic environment - guidance
Conducted RF IEC/EN61000-4-6	3Vrms 150kHz to 80MHz	3Vrms	Portable and mobile RF communications equipment should be used no closer to any part of the RadiForce series, including cables, than the recommended separation distance calculated from the equation applicable to the frequency of the transmitter.  Recommended Separation distance  $d = 1.2 \sqrt{P}$  $d = 1.2 \sqrt{P}, 80MHz to 800MHz$ $d = 2.3 \sqrt{P}, 800MHz to 2.5GHz$  Where "P" is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer and "d" is the recommended separation distance in meters (m).  Field strengths from fixed RF transmitters, as determined by an electromagnetic site survey <sup>a</sup> , should be less than the compliance level in each frequency range <sup>b</sup> .  Interference may occur in the vicinity of equipment marked with the following symbol. 
			NOTE 1 At 80 MHz and 800 MHz, the higher frequency range applies.  NOTE 2 These guidelines may not apply in all situations. Electromagnetic propagation is affected by absorption and reflection from structures, objects and people.

<sup>a</sup> Field strengths from fixed transmitters, such as base stations for radio (cellular/cordless) telephones and land mobile radios, amateur radio, AM and FM radio broadcast and TV broadcast cannot be predicted theoretically with accuracy. To assess the electromagnetic environment due to fixed RF transmitters, an electromagnetic site survey should be considered. If the measured field strength in the location in which the RadiForce series is used exceeds the applicable RF compliance level above, the RadiForce series should be observed to verify normal operation. If abnormal performance is observed, additional measures may be necessary, such as reorienting or relocating the RadiForce series.
<sup>b</sup> Over the frequency range 150 kHz to 80 MHz, field strengths should be less than 3 V/m.

### **Recommended separation distances between portable and mobile RF communications equipment and the RadiForce Series**

The RadiForce series is intended for use in an electromagnetic environment in which radiated RF disturbances are controlled. The customer or the user of the RadiForce series can help prevent electromagnetic interference by maintaining a minimum distance between portable and mobile RF communications equipment (transmitters) and the RadiForce series as recommended below, according to the maximum output power of the communications equipment.

Rated maximum output power of transmitter W	Separation distance according to frequency of transmitter m		
	150kHz to 80MHz $d = 1.2 \sqrt{P}$	80MHz to 800MHz $d = 1.2 \sqrt{P}$	800MHz to 2.5GHz $d = 2.3 \sqrt{P}$
0.01	0.12	0.12	0.23
0.1	0.38	0.38	0.73
1	1.2	1.2	2.3
10	3.8	3.8	7.3
100	12	12	23

For transmitters rated at a maximum output power not listed above, the recommended separation distance “d” in meters (m) can be estimated using the equation applicable to the frequency of the transmitter, where “P” is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer.

NOTE 1 At 80 MHz and 800 MHz, the separation distance for the higher frequency range applies.

NOTE 2 These guidelines may not apply in all situations. Electromagnetic propagation is affected by absorption and reflection from structures, objects and people.
